Order from SLA \$1.10

Trans. of Chemische Industrie (West Germany) 1961,
v. 13, no. 3, p. 133-134.

DESCRIPTORS: *Phosgene, Production.

The new importance of this notorious poison gas known from the first world war, is based upon its application as an intermediate for a series of important chemical products. As an example, the demand for phosgene has increased due to the boom in the polyurethane-foams, which are made from toluylene diisocyanate which in turn is prepared over phosgene. According to American estimates the United States consumed approximately 50000 tons of polyurethane-foams in 1960. It is expected that this amount will have tripled by 1965.

An electronic micro-scale which can register changes
in weight up to 10 mg is presented. The time response
is extremely rapid, which is a result of the inherent
electronic damping. The maximum loading per scale is
one gram. The system is purposely based on a two-arm
symmetrical design in order to eliminate buoyancy dif-
ferences which are inherent in a one-arm system. This

unit with its accessories is first briefly described.
Next is discussed a tower apparatus for the separation
of liquid mixtures into two components which has found
remarkable success in a great variety of applications.

Previous processes for the separation of high-melting
and low-melting metals in the shaking-screen and
drum-sieve apparatuses for obtaining the white metal
in the liquid or pulverulent state; separation by heating
in paraffin, heavy oils, and anthracene; more recent
experiments on the separation of the metals in salt
fusions; and apparatus requirement.
